

MOTORS

Servo Motors

A servo motor is a motor whose shaft turns to position something based off a control signal. Control of the shaft position comes from using a pulse width modulation signal (PWM) to turn the shaft clockwise or counterclockwise, depending on the pulse width of the signal. See the timing diagrams below that show how they work.

Example part numbers:
900-00005-ND
1528-1076-ND
1568-1878-ND

Specifications

Pin	Name	Description	Min.	Typ.	Max.	Units
1 (White)	Signal	Input: TTL or CMOS	3.3	5.0	Vservo + 0.2	V
2 (Red)	Vservo	Power Supply	4.0	5.0	6.0	V
3 (Black)	Vss	Ground		0		V

DC Motors and Drivers

Many projects use DC Motors in robotics to help control their action. Here are a few examples:

Example
part number:
1528-2589-ND

Example
part number:
1528-1719-ND

Example
part number:
1528-1150-ND

Vibration Motors

These motors help create a vibrating movement for alerting about something.

Example
part number:
1670-1060-ND

Example
part number:
1670-1079-ND

Example
part number:
1528-1177-ND

Stepper Motors

These motors are valuable for many applications including robotics, printers, CNC machines, and precision control systems.

Example
part number:
1460-1076-ND

Example
part number:
1528-1548-ND

Example
part number:
1568-1066-ND

Crickit Motor Driver by Adafruit

Example
part number:
1528-2671-ND

- 4 x Analog or Digital Servo Control
- Precision 16-bit timers
- 2 x Bi-directional brushed DC motor (with 8-bit PWM speed control)
- 4 x High current "Darlington" (500 mA drive outputs)
- 4 x Capacitive touch sensors
- 8 x Signal pins, digital/analog inputs
- 1 x NeoPixel driver
- 1 x Class D, 4-8-ohm speaker (3 W-max audio amplifier)
